

# Once your customers have submitted your forms with that all-important signature, are you still left with the headache of data entry?

You need your paper form returned to you via mail or fax, complete with all of the blanks filled in and a hand written signature attached. And then you're faced with the time and toil of manually transferring the information from that form into your computer. But what if you could transfer the information instantly and accurately, with a single click?

The ADDAM Barcode 1-2-3 solution is intended for those organizations that process significant numbers of paper forms requiring signatures from the form submitters.

The solution eliminates the need to manually re-enter the information from the paper form into your electronic repositories.

## The ADDAM Barcode 1-2-3 Solution:

1. Run your PDF forms through ADDAM Barcode so that the form is now 'Barcode-Enabled'. If your forms are not already fillable, we have a tool for that too.
2. Make the new form available on a website for your customers to access. After your customer has filled in the form, he or she will print it to affix their signature. The printed form will include a bar code that contains all the information that was entered in the form fields. The customer then physically mails or faxes the form to you.
3. You scan the form with a simple handheld bar code scanner, and all the data contained within the bar code is automatically entered into the program or database of your choice.
